Oil & Gas going much higher for a Bubble Market Top

Rather than continuing to drop as most expect, oil after a slight pullback, will move up energetically to a new high, to complete a *Bubble Market Top*. What is a bubble market top you ask? Below is the Dow's Bubble Market Top in March 2000: it consists of an (a)-(b)-(c), characteristic of a corrective wave, rather than the normal 5 wave, impulse progression. As you see to the far right we are in the process of a second Bubble Market Top in the Dow, where the (c) completes in a new all-time high. By our estimation no sooner than the 3rd Q 2009, and possibly extending another year.

We have a very similar formation in the energy index: three diagonal triangles (Diag >) indicating a violent reversal once the **C** wave peaks. The larger **a-b-c** echoing the smaller **a-b-a** completing just above 90 on the vertical axis.

Upon closer examination the hourly chart reveals a slight upside to complete **wave ii**, followed by **iii**, **iv** and **v** to complete **wave II** for a minimum downside of 72.5 and likely quite a bit below. (Once a Diagonal peaks, it swiftly retraces at least to the point where it began). Once this **wave II** bottoms, with expectations of further plummeting, oil longs will be very attractively priced, low risk/high return opportunities. Right afterwards we turn up sharply into a powerful **wave III**, catching nearly everyone but you, by surprise.

This original, empirically-derived research, is not available anywhere else. The *Bubble Market Top* formation was coined by me. Knowing the Dow and Oil will mirror each other on the way up to all-time highs is quite an investing advantage. To learn about other such money-making opportunities, why not subscribe? There's a 30-day, no risk money-back guarantee.

Regards,

Eduardo Mirahyes
